What is the Illinois Youth Survey?

Overview

The Illinois Youth Survey is a biennial survey of 8th, 10th, and 12th grade students. The IYS is a self-report survey administered in school settings and is designed to gather information about a variety of health and social indicators including substance use patterns and attitudes of Illinois youth. The Illinois Department of Human Services (IDHS) has funded the administration of the Illinois Youth Survey (IYS) biennially since 1990.

The administration of the IYS has two major goals:

- To supply local data to schools and school districts throughout Illinois.
- To provide a scientific estimate of health and social indicators for the state of Illinois.

2018 Data

In 2018, the Illinois Youth survey included over 230,000 youth across more than 970 Illinois schools who were surveyed between January and June of 2018. The data in this paper is based on a statewide randomly drawn, scientifically weighted sample of 11,259 students, selected to represent the state population of 8th, 10th, and 12th graders in Illinois’ public schools, distributed across the grades as shown below. The sampling design assures that youth in the state sample are representative of the state’s diverse community types.

Why is it important to track youth alcohol use?

Alcohol is the most frequent substance used by teens in Illinois. State policies regarding alcohol and available alcohol products have remained largely unchanged for many years, yet teen use patterns continue to change in a variety of significant ways. This report provides information on alcohol use patterns, including where youth get their alcohol, young persons’ perceptions about alcohol use and perceived use among their peers, and consequences of teen alcohol use including drinking and driving. It offers insights on use statistics based on grade, race, gender, community type, and trends. Use this paper to learn the facts about alcohol use among youth in Illinois.

Illinois vs. National Trends

Since 2008, data have shown that self-reported teen use of alcohol is continuing to trend downwards in the state of Illinois. While this is a positive trend, Illinois' rates of teen alcohol use have been above national measures of the same statistics for many years, and this has not changed. In 2018, while fewer teens used alcohol than in 2016, our state is still above national averages for past year alcohol use and past 30 day alcohol use. In Illinois, over one in four 8th graders has used alcohol in the past year, with over half of those having used it in the past 30 days.

Past 30 Day Alcohol Use: Illinois & National Trends
Youth Usage Summary

- During 2018, nearly one quarter of teens reported some alcohol use in the past 30 days.
- While rates have continued to fall over time, 2018 marked a sharp uptick in usage rates among Illinois 8th Graders.
- Binge drinking is slowly but steadily declining across all age groups in Illinois, most notably among seniors.

Past 30 Day Alcohol Use

Closer Look: High School Seniors

- Seniors have the highest rates of all types of alcohol use across grades, but reflect similar trends.
- More than half of all seniors reported using alcohol in 2018.
- 1 in 10 seniors reported being drunk or high during school.
While senior drinkers use multiple varieties of alcohol, these statistics show which types of alcohol are most popular among them. Most notable is the prevalence of liquor among senior users, which has fallen considerably but is still the most popular type of alcohol. Wine has also become more popular than alcopops (sugary, bottled alternatives to beer) in 2018, and it is the only drink type trending upwards in popularity.

Drink preference can vary significantly by race and gender. For example, only 13% of African American drinkers reported having drank beer from a can or bottle in the past 30 days, while this number was over 50% for both White and Latino/Latina drinkers. Male drinkers reported much higher use of beer than females, while females reported drinking more wine and alcopops. For all users regardless of gender, race, or other demographics, rates of liquor use are much higher than other types of alcohol.
Understanding how teens get access to alcohol is a major part of the prevention puzzle. While it is encouraging that perceived ease of access among teens has generally been trending downwards, the rates are still concerning. In 2018, the majority of high school students responded that it would be at least "sort of easy" to acquire alcohol.

IYS data shows that the vast majority of teens got their alcohol socially. This trend is most distinct in high school seniors, among whom 57% of alcohol users have accessed alcohol through their friends.

Only a minority of teen alcohol users reported accessing alcohol from retail sources (bars, restaurants, stores, and gas stations).
Youth Perceptions of Alcohol Use

Why do these numbers matter?

Teens’ perceptions have a deep impact on their actions. When teens believe that more of their friends are using substances such as alcohol, it can effect their decision making and choices about whether or not to use it as well. Between all surveyed grades, social sources were the most common type of access to alcohol for teens. The most popular single source of alcohol for all teens was reported as "A friend gave it to me." For these reasons, it is critical to understand what youth believe about the risks, norms, and consequences of teenage alcohol use.

What else do teens believe?

It is important for teens to understand the risks that alcohol pose not only to their bodies but to their actions and their futures. While the majority of teens believe there is at least a moderate risk of drinking regularly or binging, many of these teens chose to use alcohol anyway.
Drinking and driving is the most deadly and pervasive consequence of alcohol use, as it can injure or kill not only those responsible but others in the car and innocent drivers as well. In Illinois, teen rates of drinking and driving have declined over the last decade; only 6% of high school students reported driving drunk in the past year. However, a higher number of teens reported being in a car with an intoxicated driver. In 2018, over a quarter of high school seniors reported riding with a drunk driver (including themselves). This means that one in four high school seniors is at direct risk of drunk driving accidents.

Rates of drinking and driving in Illinois vary by region. Chicago has the lowest rate of teen drunk driving at 5%, while rural areas have the highest rate at 11%. This may be due to the fact that alternative modes of transportation are much more available in cities like Chicago, and teen drinkers in rural areas may be more likely to drive long distances to access alcohol.
How Can Parents Make a Difference?

Parents can affect their teens’ alcohol use both positively and negatively. Some parents may choose to have lax rules or even provide alcohol to their teens, while others enforce clear rules and choose to educate their teens on the risks and facts about using alcohol underage. However, more and more parents are choosing to have responsible conversations with their teens about using alcohol, including the dangers that come with driving under the influence.

While this trend is positive, there is always room for improvement. Despite these promising statistics, only about half of teens reported that their parents talked with them about not using alcohol in the past year. Having conversations with your teens can help to reaffirm household attitudes against drinking. Additionally, it is important to remember that while some parents may choose to allow their teens to use alcohol in a "safe" environment at home, it is illegal for any adults to provide alcohol to minors in Illinois.

Closer Look: Drunk Driving by Region

Parent Influence in Drunk Driving

While the number of students who reported having conversations with their parents about driving drunk was lowest in Chicago and highest in rural areas, those who reported riding with drunk drivers was highest in rural areas and lowest in Chicago. This is most likely related to the lack of alternative modes of transport in rural areas. Unfortunately, parents cannot solve the problems of teen alcohol use alone - but every conversation helps. Furthermore, while drinking underage should not be condoned, it is always safer for students to feel they can call their parents than to try and drive home if they have been drinking, or to ride with a drunk driver.
While youth alcohol use in Illinois is declining, it is still higher than national trends across all grades surveyed. Drink preferences may vary demographically, but liquor is the number one choice for teen drinkers. Teens perceive alcohol as easy to obtain, and are able to get it from a variety of sources including friends, parties, and parents. Alcohol is used primarily for social reasons among youth. Most teens overestimate the number of their classmates who are using alcohol. The number of teens who reported driving drunk in the past year has continued to decline, however, over 25% of high school seniors have been in a car with a drunk driver in the past year. Parents can help by setting rules and educating their teens on the facts about underage alcohol use.

Illinois State Report

This report provides an overview of Illinois Youth Survey data relevant to teen alcohol use. If you are interested in the full data for alcohol use and other teen behaviors, please refer to the Illinois State Report.

To Sum Up: Takeaways for Youth and Alcohol Use in Illinois

- While youth alcohol use in Illinois is declining, it is still higher than national trends across all grades surveyed.
- Drink preferences may vary demographically, but liquor is the number one choice for teen drinkers.
- Teens perceive alcohol as easy to obtain, and are able to get it from a variety of sources including friends, parties, and parents.
- Alcohol is used primarily for social reasons among youth.
- Most teens overestimate the number of their classmates who are using alcohol.
- The number of teens who reported driving drunk in the past year has continued to decline, however, over 25% of high school seniors have been in a car with a drunk driver in the past year.
- Parents can help by setting rules and educating their teens on the facts about underage alcohol use.
